complete bibliographical index

Paralleling the organization of the Annual Indexes from The Quarterly Update (formerly The Quarterly Child Abuse Medical Update), this complete bibliographical index of articles is arranged by subject area.

The volume, number and page of the review of each article in The Quarterly are listed at the end of each reference. See example:

If you do not have a complete set of Quarterly issues, Helfer members and subscribers may access back issues online at www.helfersociety.org/quarterlyupdate. If you need a copy of an original article, inquire at a library affiliated with a medical school or hospital. Libraries often have original journal articles available onsite or through an internet ordering system.

Subjects

Brief resolved unexplained events (formerly apparent life-threatening events) and evaluation of lower-risk infants. *Pediatrics* 2016;137(5); DOI: 10.1542/peds.2016-0590. Vol. XXIII, No. 4, p. 16.

Research in the medical field has explored various conditions and their implications, including coagulation tests and traumatic intracranial injuries. Studies have been conducted to understand the role of hypernatremia in subdural hematoma development in children. Research on traumatic brain injury has also examined synaptic plasticity and its effects. Injury mechanisms have been studied, with a focus on subdural hemorrhage and its intrauterine occurrence. The relationship between vitamin D deficiency and childhood sexual abuse has been investigated. Analysis of pediatric burns has provided insights into causative factors and outcomes. The historical context of child abuse has been explored, highlighting the importance of child abuse and partner abuse prevention. Further research has focused on the early detection and quality assessment of child abuse and partner abuse, achievable with formal organizational change approaches. The implementation of RetCam screening for retinopathy of prematurity has been studied, with long-term outcomes. Osteogenesis imperfecta has been reviewed, including the role of Danlos syndrome. Skin lesions caused by burns or phytophotodermatitis have been discussed, sometimes attributed to child abuse or neglect. Masses involving the testes have been addressed in a pediatric context. The law on expert medical evidence has been reformed, involving the medical profession. The use of fig leaves has been documented, and the role of firearms in child abuse has been identified. The use of certain formulae has been examined, with studies on the accuracy of abdominal examination for traumatic injuries. Neonatal jaundice has been analyzed, with considerations for the Pediatric Emergency Care Research Network. The use of ultrasonography in the diagnosis of blunt abdominal trauma has been discussed. Skin lesions due to congenital urethral polyps have been described, with considerations of differential diagnosis. The process of resterilization and its implications have been explored. Public policy and related disease states have been discussed, with references to policy and public health issues.
